

Review of classmate's Alexander Gyurov code:

- 1) checkTriangleMax() method of the PotentialTriangle class is declared as public, but should instead be private as has no valid use outside the scope of the class
- 2) violatesTriangleInequality() method performs the same task as checkTriangle() which therefore makes one of them redundant
- 3) program lacks the ability for user to enter input, even via a console, and thus requires hard-coding values into the source code prior to each execution
